Shields MS;  Francorganisms transformed with P. cepacia FR1-23 Tom enzyme are useful for degradation of chloro:allphatic cpds. and aro claim 1; Column 29-32; 25pp; English.  N-PSDB; T44457.  N-PSDB; FRANCESCONI S C.  The present sequence is that of toluene ortho-monoxygenase toma3 encoded by T44457, isolated from Pseudomonas cepacia stoma3 encoded by T44457, isolated from Pseudomonas cepacia coma3 encoded by T44457, isolated from Pseudomonas cepacia SFR1-3. The Tom gene is present on a large self-transmissable denoted prom. The enzyme is capable of degrading trichloroet (TCB), a hazardous pollutant. The promy bacteria can be generated to constitutively degrade TCB, esp. in bioreactors of altered to constitutively degrade TCB, esp. in bioreactors of the expressable in other bacteria, thus many bacteria can be gen altered to constitutional inducers and is capable of functionined exogenous chemical inducers and is capable of functionined consubstrate for the enzyme required to break down TCE, in experiments. The present sequence encodes Alcaligenes sp. protein PoxD. The present invention also describes PoxA, PoxB, PoxC, PoxR, PoxE, PoxF, PoxF, PoxE, and PoxI. The proteins are useful in the fields of petroleum purification, chemical industry and drug industry related to the synthesis, conversion and decomposition of aromatic compounds.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        epoxidation of an alkene Claim 1: Page 3-4; 30pp; Japanese. E.coli transformed with the DNA sequence 0/9569 are able to E.coli transformed with the DNA sequence 0/9569 are able to catalyse the epoxidation of alkenes. The DNA is derived from Nocardia corallina and comprises 4 open reading frames. ORFs amoA and amoC encode subunits 1 and 2 of the alkene monoxygenase enzyme and ORF amoD encodes a reductase capable of transferring electrons

R81469-R81472 are protein products of the Nocardia corallina strain
B-276 alkene mono-oxygenase gene. The gene encodes 4 protein products
amoA, amoC and amoD derived from the 3 different reading frames
of the operon. The gene is useful for the production of indigo via
contg. indole and will readily oxidise the indole yielding indigo into
the culture medium. E. coli may also be transformed with the alkene
by microbial oxidation.

E.coli transformed with the DNA sequence 079569 are able to E.coli transformed with the DNA sequence 079569 are able to catalyse the epoxidation of alkenes. The DNA is derived from Nocardia corallina and comprises 4 open reading frames. ORFs amoh and amoc encode subunits 1 and 2 of the alkene monoxygenase enzyme and ORF amob encodes a reductase capable of transferring electrons

                                                                                                                                                                                                         claim 5, Page 6-7; 11pp; Japanese. It he Nocardia corallina strain R81469-R81472 are protein products of the Nocardia corallina strain B-276 alkene mono-oxygenase gene. The gene encodes 4 protein products amon, amoc, and amo derived from the 3 different reading frames of the operon. The gene is useful for the production of indigo via oxidation of indole. Nocardia corallina can be cultured in a medium contg. Indole and will reading voxidise the indole yielding indigo into the culture medium. E. coli may also be transformed with the alkene mono-oxygenase gene and used as above to efficiently produce indigo by microbial oxidation.

                                                                                                                                                                                                                                                          strearchermophilus. The variants of the invention were created using strearchermophilus. The variants of the invention can have improved parent alpha-amylases. The variants of the invention can have improved thermal stability (such as at temperatures in the range of 40-70 degrees thermal stability (such as at temperatures in the range of 40-70 degrees celcius), and/or oxidation stability, and/or reduced calcium ion dependency. The variants can also have increased alpha-amylases are sepecially at ph values in the range of 8.5-10.5, and improved binding of a particular substrate. The variants also possess improved specificity to a particular substrate, and/or improved specificity with respect to cleavage of substrate. The variants can be used in detergent and washing compositions, and for textile can be used in detergent and washing compositions, and for textile desizing. The alpha-amylase variants of the invention can also be used in papermaking and beer-making processes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              300 YAEQNGGALFKDLARYGIREPKGWQDACEGKDHISHQAWSTFYGFNAASAFHTWVP---T 356

Bacillus sp. alpha amylase.
Alpha amylase; hard surface cleaning; dishwashing; laundry.
Bacillus sp.
W09732961-A2.
                                                        Alpha-amylase variants - with improved thermal and oxidation stability and reduced calcium ion dependency
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       beer-making processes. The variants of the invention the production of sweeteners and ethanol from starch.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          297 TASKSGGTEDMRT-----LMTNTLM------KDQPTL---
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 242 GIECIKFLLEQDPDNVPIVQRWIDKWF-------WRGYRLL-

                                                               Detergent compositions for hard surface cleaning and laundry use contains Bacillus derived alpha amylase with improved thermostability, reduced calcium ion dependency etc.

Claim 1: Page 91: 97pp; English.

The present sequence is a Bacillus sp. alpha amylase with a specific activity at least 25% higher than that of Termamyl (RTM) at 25 to 55 degrees C at pH W to 10, measured by the Phadebas (RTM) machine dishwashing and laundry at a temperature of 10 to 25 degrees C. Improved cleaning, stain removal and fabric care are obtained by using it at a concentration of 0.00018 to 0.06%
                                                                                                                                                                                                                                                                                                                                                                                                                                 122 RHFTGEGARIACOMQSIDELRHYQTETHAMSTYNKFFNGFHHSNQWFDRVWYLSVPKSFF

                                                                        Human angiotensin converting enzyme hydrolyses angiotensin I and kinins. Either intext enzyme or fragments thereof can be used to generate antibodies for diagnostic use. Oligonucleotide probes can also be made which are complementary to the sequence encoding the enzyme.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             979 NLEDLVVAHHEMGHIQYFMQYKDLPVALREGANP---GFHEAIGDVLALSVSTPKHLHSL 1035

protein, and comparing IAA protease activity in the presence and absence of a test compound. S. pneumoniae cells or isolated IBAA protease enzyme can be used in this method. The antibiotic is used to treat S. pneumoniae or other bacterial infections. The invention also relates to a subunit vaccine comprising an isolated the severity of (S. pneumoniae) infections.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           New DNA encoding Streptococcus pneumoniae IgA protease - and antibiotic screening assay and subunit vaccine etc claim 11; Fig 4; 66pp; English.

This is the amino acid sequence of Streptococcus pneumoniae IgA protease, deduced from an isolated iga gene (see V69165). The invention provides a method of identifying a candidate antibiotic compound that involves incubating the IgA protease with an IgA.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  1605. .1609

Patent No. 554317
Patent No. 554317
GENERAL INFORMATION:
APPLICANT: Shields, Malcolm S.
APPLICANT: Francesconi, Stephen C.
TITLE OF INVENTION: Microbial Degradation of Trichloroethylene, TITLE OF INVENTION: Dichloroethylenes and Aromatic Pollutants NUMBER OF SEQUENCES: CORRESPONDENCE ADDRESS: ADDRESSEE: Saliwanchik & Saliwanchik
                                                                                                                                                                                                                                                                                                                                      COMPUTER READABLE FORM:
MEDIUM TYPE: Floppy disk
COMPUTER: IBM PC compatible
OPERATING SYSTEM: PC-DOS/MS-DOS
SOFTWARE: Patentin Release #1.0, Version #1.25
CURRENT APPLICATION DAIR:
APPLICATION NUMBER: US/08/319,387
                                                                                                                                                                                                            ADDRESSEE: Saliwanchik & Saliwanchik

Mammalian cell with reduced activity of low Km hexokinase - caused by competitive enzyme inhibitor, particularly an insulin secreting cell for in vitro or in a competitive inhibitor or in vitro includes enough of a mammalian cell has been developed which includes enough of a mammalian cell has been developed which includes enough of a reduce the hexokinase activity in the cell. The present sequence represents trehalose-6-phosphate synthase used in the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Trehalose-6-phosphate synthase.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The cells are particularly used to produce insulin, in response to glucose or other secretagogues, either in vitro or in vivo (for treating diabetes), but may also be used to produce many other therapeutic proteins, e.g. from a gene under control of the insulin promoter and thus responsive to glucose. Inhibition of the inhibitor can be used more generally to reduce the growth rate of cells, e.g. sequence 495 AA;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            14 KDAVEKFPAPLLYVCWENHLMFPAPFCLPLPPDMPFGALAGDVLPPVYGYHPDFAKIDWD 73

by specific ribozyme or stimulator of trehalose-6-phosphate production, particularly for in vitro or in vivo insulin production Claim 13; Page 152-154; 265pp; English.

A mammalian cell has been developed comprising an effective amount of a low Km hexokinase-inhibitor selected from: (a) an agent that stimulates production of trehalose-6-phosphate (16P); or (b) a ribozyme specific for low Km hexokinase. The present sequence represents yeast trehalose-6-phosphate synthase. The cells are particularly used to
                                                                                                                              produce insulin, in response to glucose or other secretagogues, cither in vivo (for treating diabetes), but may also be used to produce many other therapeutic proteins, e.g. from a gene under control of the insulin promoter which is therefore responsive to glucose. Growth-inhibited cells (having altered haxokinase activity) are used to Produce proteins, e.g. insulin or antibodies, in vivo or in vitro. Reduction in low Km hexokinase activity provides cells in which insulin secretion is induced at glucose concentrations closer to the normal range than in the parent cell (nearly homeostatic secretion). Implanted cells of reduced low Km hexokinase activity are expected to survive
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      This sequence represents a fragment of a human protein which contains a SRCR (scavenger receptor, cysteine-rich) domain. The gene and encoded protein can be used to diagnose or treat tumours, particularly of the nervous system (medullo-blastoma or glioma) or breast. The DNA sequence and probes derived from it, are used to identify genes that express SRCR-domain containing proteins, to determine the form in which these proteins exist and to assess the significance of individual forms on cellular properties. The protein can be used to detect the presence of sequence 666 AA;
                                                                                                                                                                                                                                                                                                                                                                                                                                               Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Human SRCR protein fragment.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           This sequence represents a human protein which contains a SRCR (scavenger receptor, cysteine-rich) domain. The gene and encoded protein can be used to diagnose or treat tumnours, particularly of the nervous system (medullo-blastoma or glioma) or breast. The DNA sequence and probes containing proteins, to determine the form in which these proteins exist properties. The significance of individual forms on cellular proteins can be used to detect the presence of autoanticodies and antibodies which regulate its expression.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The present sequence represents the Saccharomyces cerevisiae trehalose synthase. The invention provides methods of preserving prokaryotic cells which involves inducing the intracellular trehalose production of the prokaryotic cell to an amount which effectively allows increased storage stability and drying of the cells in the presence of a stabilising agent. Therefore, prokaryotic cells known to synthesise trahalose, such as S. cerevisiae, can be used to illustrate the methods of the invention. Bacteria tabilised by these methods showed less than 10% loss of viability on storage even after being stored at temperatures up to at least 37 degrees centigrade for as long as 6 weeks. The invention claims the methods to be useful for producing dried, stable probaryotic cells such as bacteria useful for pharmacological treatment, prophylaxis, agricultural and industrial applications. The invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             also claims the methods to be useful for producing live bacterial vaccines in a dry stable form, live bacterial neutraceuticals in a dry stable form and other live bacterial pharmaceuticals in a dry stable form, e.g. for treatment of vaginal or urinary tract infections.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Saccharomyces cerevisiae trehalose synthase. Trehalose synthase, stabilising agent; prokaryotic cell preservation; prophylaxis; live bacterial vaccine; vaginal infection; urinary tract infection; live bacterial neutraceutical.
                                                                                                                                                                                                                                                                                        Disclosure; Figure 1; 26pp; French.
Yeast strains transformed with an altered GGS1 gene are resistant to stress and/or have an altered sugar metabolism. The transformed yeast can be used in industry for the production of bread, alcohol and beverages and has resistance to at least one of drying, osmotic shock (especially in sugar containing doughs) and freezing.

Preferably the yeast also has higher trehalose content with delayed trehalose mobilisation.
                                                                                                                                                                                                                                 Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Preservation of prokaryotic cells - by increasing intracellular trehalose concentration, mixing with a stabilising agent, and drying to produce a glass form of the stabilising agent Disclosure; Pages 39-40; 64pp; English.

The present sequence is the Bordetella pertussis ptsE, which is 1 of the proteins encoded by the pts gene that facilitate the extracellular export of the pertussis holotoxin (ptx), namely ptsAB, ptsC, ptsB, ptsE, and ptsG. A secreted ptx can be produced by culturing an E. coli or Bordetella host transformed

DNA encoding poly-hydroxy-alkanoate decomposing enzyme - useful for preparing poly-hydroxy-alkanoate in large quantities claim 3; page 13-14; 15pp; Japanese.

K63805 is encoded by ORF 2 of 063789, which produces a polypeptide which shows polyhydroxyalkanoate decomposing activity. The method used allows the polypeptide to be prepared in large quantities.
 Nuclear factor of gene expressing and deriving IL 6 gene - codes factor combined sequence of structure for transcriptional control

New nucleic acid encoding human interleukin 11 receptor - and related protein, antibodies, receptor antagonists, etc, useful for treating and preventing loss of bone mass claim 13, Page 35-37; 54pp; English.

Claim 13, Page 35-37; 54pp; English.

C Human interleukin-11 (IL-11) receptor (R99090) is thought to play a role in the regulation of bone maturation and repair. Its amino acid sequence was deduced form a cDNA clone (T3378) isolated from a human activated peripheral blood mononuclear cell cDNA library.

C Recombinant IL-11 receptor or its fragments, pref. amino acids 24-422, 24-365 (soluble extracellular domain), 391-422, 102-422 or treat/prevent loss of bone mass (e.g. osteoporosis, Paget's disease, multiple myeloma or hypogonadal conditions), as well as immune

This sequence represents a human papillary renal cell carcinoma (PRCC) associated protein and is used in a method for the diagnosis.

prophylactic and therapeutic treatment of papillary renal cell carcinoma. The translocation t(X:1) (pl1.2:q21.2) found in PRCC results in a fusion of the transcription factor, TFB3 quee with a new chromosome I gene designated PRCC (at 1q21.2), resulting in expression of a fusion protein Normal TFB3 transcripts are no longer produced. Two other fusion partners for TFB3 have also been detected; Non0, from a invX (pl1.2; q13-24 or 12) translocation and the PSF splice factor gene, resulting in t(X:1) encountered in patients younger than 25.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       18; Gaps
                                                                                                                                                 Nucleic acid encoding haemopoietin receptor containing conserved amino acid encoding haemopoietin receptor alpha chain - used for developing IL-II (ant)agonists
Claim 8; Page 47-49; 87pp; English.
The human interleukin-II (IL-II) receptor alpha chain (R92814)
was identified by expression of DNA (17869) isolated from human bone marrow cDNA libraries. Expression of the human IL-II
and permits IL-II signalling. The receptor alpha chain can be used to develop agonists or antagonists of therapeutic appla.
The treatment or diagnosis of conditions involving a deficiency of IL-II, excess IL-II or aberrant effects of normal endogenous IL-II
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Diagnosing papillary renal cell carcinoma by detecting gene trans-location - resulting in fusion of FPE3 gene with some other gene, also related vectors, transformed cells, specific binding reagents, peptide(s) encoded by fusions and therapeutic anti-sense
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Human chromosome I PRCC associated protein.
